

# TORAKS

Paravertebral mi?

EPİDURAL MI?

Dr. Elif Başağan Moğol

Uludağ Üniversitesi Tıp Fakültesi  
Anesteziyoloji ve Reanimasyon AD

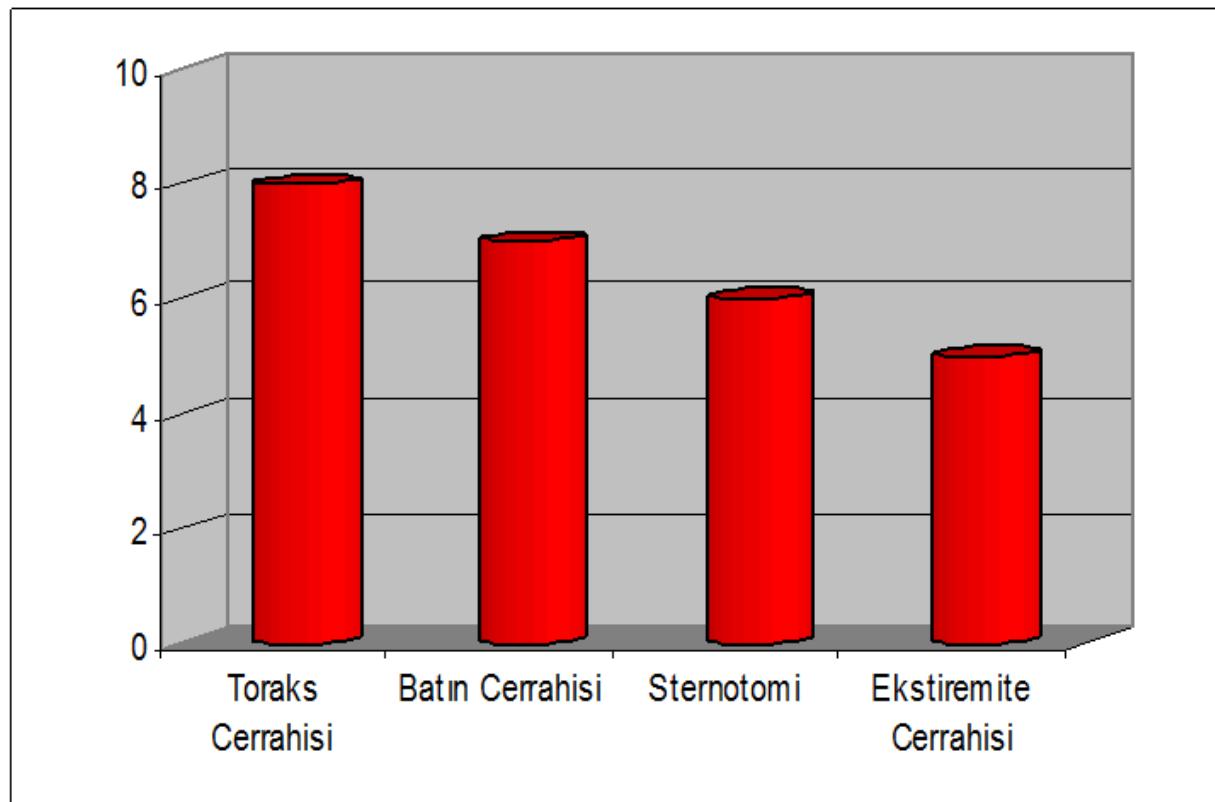

## Akciğer patolojileri

- Akciğer kanseri
- Pnömotoraks
- Plevral efüzyon
- Biyopsi
- Travma

## Cerrahi prosedürler

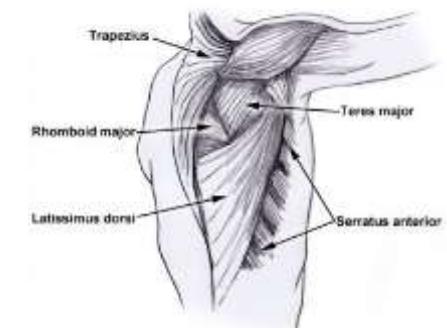

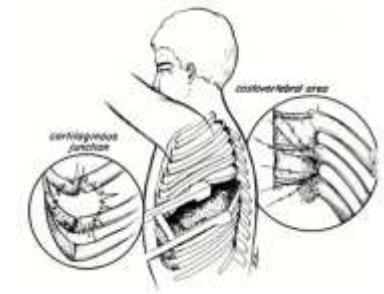

- Açık torakotomi
- Torakoskopi VATS
- Mediastinoskopi
- Mediastinotomi
- Bronkoskopi

# Postoperatif ağrı şiddeti

# Toraks operasyonlarında ağrı nedenleri

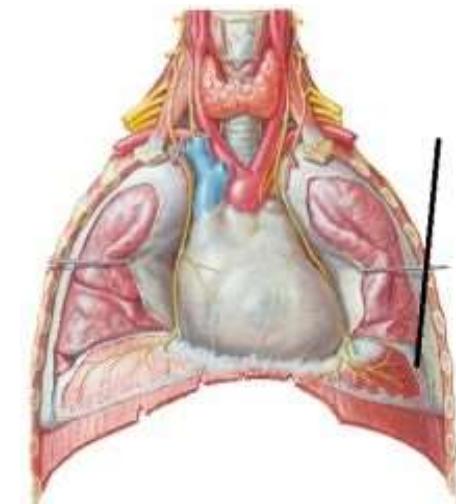

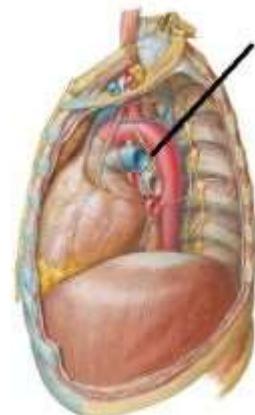

- Cilt insizyonu (ant spinal dal)
- Göğüs duvarının insizyonu ve inflamasyonu
  - Kaslar (post spinal kasların retraksiyonu/post spinal dal)
  - Akut kostokondrit
  - Kosta hasarı
  - Kostovertebral yapılarının hasarı
  - Akut interkostal nevralji
- Pariyetal plevra

## SOMATİK İTERKOSTAL SINIRLER

# Toraks operasyonlarında ağrı nedenleri

- Diyafragma
- Mediasten
- Akciğer
- Perikardiyal plevra
- Visseral plevra

SEMPATİK      FRENİK VE VAGAL    SİNİRLER

# Yetersiz ağrı tedavisinin sonuçları

- Pulmoner komplikasyonlar ↑
- Trakeal entübasyon ve ventilasyon süresinde ↑
- YB süresinde ↑
- Reentübasyon gereksiniminde ↑
- Hastanede kalış süresi ↑
- Kronik persistan cerrahiye bağlı ağrı ↑
- Ruh sağlığında bozulma
- Günlük yaşama dönüste gecikme
- Hasta memnuniyetinde ↓

# Multimodal Analgesia Techniques and Postoperative Rehabilitation

Girish P. Joshi, MB, BS, MD, FFARCSI

- Devamlı santral, periferik veya paravertebral blok
- Advers etkileri en az olan yöntemler tercih edilmeli
- Oral / parenteral NSAİ veya COX-2- inhibitörleri
- Asetaminofen
- Persistan postoperatif ağrı riski ↑
  - Kortikosteroidler, ketamin,  $\alpha$ 2agonistler, gabapentin vb
- İV HKA
- Preemptif analjezi ?
  - Unimodal tekniklerin kullanılması
  - Aynı zamanda farklı analjezik yolların hedeflenmesi
  - Analjezinin zamanlaması
  - *Peak* etkinin anestezi sonlanmasıından hemen önce oluşması

# A Systematic Review of Randomized Trials Evaluating Regional Techniques for Postthoracotomy Analgesia

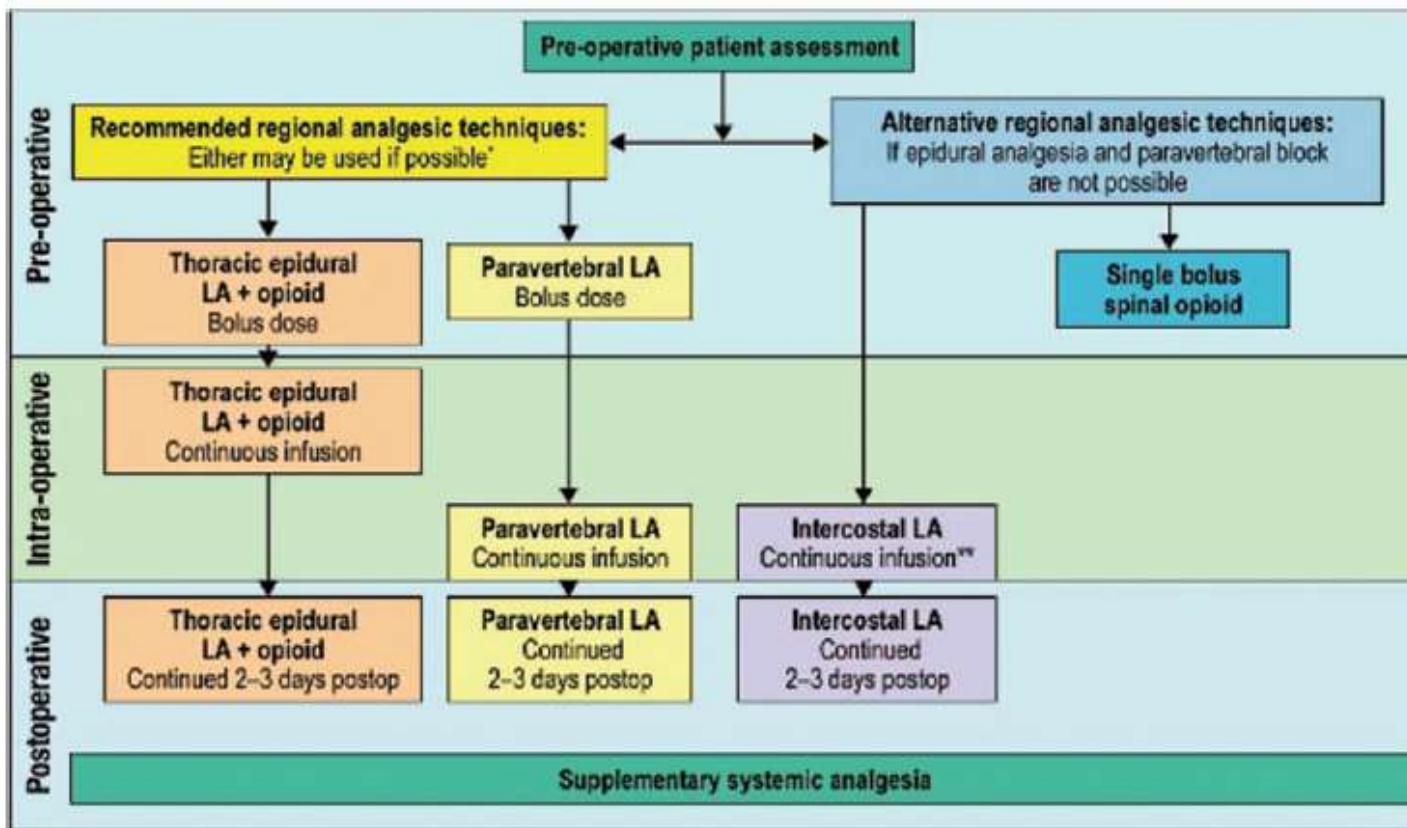

Figure 8. Overall PROSPECT recommendations: regional techniques for post-thoracotomy analgesia. \*Either thoracic epidural local anesthetic (LA) + opioid or paravertebral block with LA is recommended as the primary analgesic approach; further studies on efficacy and safety are necessary to determine which technique is superior. \*\*If intercostal LA is used, administration by continuous infusion is recommended, despite limited data, because of the requirement for continuous analgesia for the long duration of post-thoracotomy pain.

**A comparison of the analgesic efficacy and side-effects of paravertebral vs epidural blockade for thoracotomy—a systematic review and meta-analysis of randomized trials**

R. G. Davies<sup>1</sup>, P. S. Myles<sup>1,2,3\*</sup> and J. M. Graham<sup>4</sup>

- Tüm çalışmalarında      n< 130,   kör Ø

**Table 1** Characteristics of the randomized trials included in the meta-analysis. \*Each study is rated according to its quality of bias-minimization using the Jadad scale,<sup>17</sup> 0 (high bias) to 5 (low bias). PCA, patient controlled analgesia; PO, per oral; SC, subcutaneous; PR, per rectal

Study*	Type of surgery	No. of patients	Epidural block	PVB	Additional analgesics
Matthews <i>et al.</i> <sup>30</sup> (Jadad score 3)	Thoracotomy	20	Thoracic bupivacaine 0.25% bolus, then infusion	Catheter inserted post-induction; bupivacaine 0.25% bolus+infusion	None
Richardson <i>et al.</i> <sup>38</sup> (Jadad score 3)	Thoracotomy	36	Thoracic bupivacaine 0.25% bolus, then infusion	Catheter inserted by surgeon; bupivacaine 0.25% bolus+infusion	PCA morphine
Dhole <i>et al.</i> <sup>10</sup> (Jadad score 2)	Thoracotomy	30	Thoracic bupivacaine 0.5% intraoperatively, then 0.25–0.375% bupivacaine+fentanyl infusion	Catheter inserted by surgeon; bupivacaine 0.5% bolus+infusion	PO meflumenamic acid SC nicomorphine
De Cosmo <i>et al.</i> <sup>8</sup> (Jadad score 2)	Thoracotomy	100	Thoracic bupivacaine 0.25% bolus, then infusion	Single injection pre-induction, then intraoperative catheter placement by surgeon; pre-induction bupivacaine 0.5% bolus; intraoperative bupivacaine 0.25% bolus; postoperative bupivacaine 0.5% infusion	PO/PR diclofenac PCA morphine
Wedad <i>et al.</i> <sup>46</sup> (Jadad score 2)	Thoracotomy	50	Thoracic bupivacaine 0.1%+fentanyl infusion	Catheter inserted by surgeon; bupivacaine 0.5%+fentanyl bolus; bupivacaine 0.1%+fentanyl infusion	Not specified
Luketich <i>et al.</i> <sup>28</sup> (Jadad score 2)	Thoracotomy	41	Thoracic bupivacaine 0.5% bolus, then bupivacaine 0.25% infusion	Catheter inserted pre-induction; bupivacaine 0.5% bolus;	i.m. ketorolac
Leaver <i>et al.</i> <sup>24</sup> (Jadad score 3)	Thoracotomy	50	Thoracic ropivacaine 0.2%+sufentanil bolus, then infusion	ropivacaine 0.475% bolus; ropivacaine 0.3% infusion	i.v. ketorolac
Perttunen <i>et al.</i> <sup>35</sup> (Jadad score 2)	Thoracotomy	40	Thoracic bupivacaine 0.25% bolus, then infusion	Catheter inserted by surgeon; bupivacaine 0.25% bolus+infusion	Meperidine
Kaiser <i>et al.</i> <sup>17</sup> (Jadad score 2)	Thoracotomy	124	Thoracic bupivacaine 0.125%+morphine infusion	Percutaneous nerve block pre-induction, then intraoperative catheter placement by surgeon; pre-induction bupivacaine 0.25% bolus; intraoperative bupivacaine 0.5% bolus; postoperative bupivacaine 0.25% infusion	PCA morphine
Richardson <i>et al.</i> <sup>38</sup> (Jadad score 3)	Thoracotomy	29	Thoracic bupivacaine 0.5% bolus, then bupivacaine 0.125% infusion	Catheter inserted by surgeon; 0.5% bupivacaine bolus + infusion	PCA morphine

Table 2: Summary of the findings of the studies

	Pain management	Rescue analgesia	Other outcome	Complications	Comments
Matthews and Govenden [18]	Comparable analgesia in either technique up to 24 h postoperatively	Not mentioned		Hypotension and urine retention more frequent with TEA than with PVB	
Perttunen et al. [19]	Comparable analgesia in either technique at rest; TEA associated with more pain during coughing up to 4 h after surgery	Comparable postoperative morphine consumption	Comparable ventilatory and oxygenation parameters	Adverse effects were comparable in either groups	
Richardson et al. [20]	PVB provided better analgesia than TEA at rest and at coughing	Cumulative morphine consumption was higher with TEA	Pulmonary function and oximetry better in the PVB group. Glycaemic response was less in the PVB group	Hypotension was more common in the TEA group	
Blimston et al. [21]	TEA was more effective than PVB in the first 32 h, thereafter equally effective for postoperative analgesia	Equivalent postoperative opioid consumption	Comparable pulmonary and haemodynamic complications and more urinary retention with TEA. Ventilatory parameters were comparable		
De Cosmo et al. [22]	TEA provided superior analgesia up to 8 h postoperatively, then TEA and PVB were comparable	Equivalent postoperative ketorolac consumption	Respiratory parameters are comparable in either group	More minor complications in the TEA group	Patients' satisfaction is greater in the PVB group
Casati et al. [23]	PVB and TEA are equally effective for postoperative analgesia, both at rest and coughing	Comparable number of patients required rescue morphine	Respiratory parameters partial pressure of arterial oxygen/fraction of inspired oxygen concentration ( $\text{PaO}_2/\text{FiO}_2$ ) are comparable in either group	Hypotension was more common in the TEA group	
Messina et al. [24]	VAS at rest was comparable in either group	Morphine consumption was significantly higher in the PVB group	FVC was better preserved in the epidural group on Day 3		
Gulbahar et al. [25]	PVB and TEA were equally effective for postoperative analgesia	Equivalent postoperative morphine consumption	Peak expiratory flow rate (PEFR), forced expiratory volume 1 (FEV <sub>1</sub> ) and $\text{SpO}_2$ was comparable in either group	More adverse effects with the TPB group	Postoperative glucose and cortisol were similar in the two groups
Mukherjee et al. [26]	Mean duration of postoperative analgesia after single bolus injection was longer in the TPB group	Not reported (NR)	NR	Hypotension was not observed in either group	Only bolus LA was used, no postoperative infusion was used in this study
Pintaric et al. [27]	Postoperative static and dynamic VAS scores were comparable in either group	Consumption of piritramide was similar in both groups	To maintain DO <sub>2</sub> I at or above the targeted value, a significantly higher amount of colloids was required in the TEA group	In the epidural group, systolic blood pressure was significantly lower at 24 and 48 h	
Kanazi et al. [28]	TEA provided superior analgesia both at rest and coughing			The incidence of hypotension within the first 6 h was higher in the TEA group	Seven patients (33%) were converted to TEA at 3.9 (4.8) h because of an inability to maintain the VAS <sub>R</sub> score of <7 cm
Grider et al. [29]	Comparable analgesia with epidural LA and paravertebral LA; however, epidural LA + opioid provided superior pain relief	No difference in opioid use among patients using iv PCA supplementation	Postoperative spirometry was best with an epidural LA + opioid group		
Kobayashi et al. [30]	PVB was not inferior to EP with respect to the primary endpoint: The mean VAS scores at rest, 2, 24 and 48 h after thoracotomy	No significant differences in the need for additional analgesic agents	Less time to insert catheter with PVB than EP		There were no significant differences between the groups in the incidence of complications

## Analgesic efficacy and safety of thoracic paravertebral and epidural analgesia for thoracic surgery: a systematic review and meta-analysis

# Trends and New Evidence in the Management of Acute and Chronic Post-Thoracotomy Pain—An Overview of the Literature from 2005 to 2015

## REVIEW ARTICLE

Paul G. Barash, MD  
Giovanni Landoni, MD  
Section Editors

David Rodriguez-Aldrete, MD, Keith A. Candiotti, MD, Rengarajan Janakiraman, MD,  
and Yilam F. Rodriguez-Blanco, MD

Table 1. Summary of Evidence on Post-Thoracotomy Analgesia Techniques From 2005 to 2015

Technique	Improves Postoperative Analgesia?	Reduces Incidence of CPTP?	Improves Post-Thoracotomy Pulmonary Function?	Reduces Use of Opioids or Local Anesthetics?	Common Side Effects	Major Risks or Adverse Effects
TEA	Yes <sup>56</sup>	Yes, but pre-emptive TEA is not superior to postoperative TEA <sup>56</sup>	Yes <sup>2</sup>	N/A	Hypotension, urinary retention, nausea/vomiting, and pruritus	Injury to neuraxis, intrathecal injection
TPVB	Yes <sup>4-7</sup>	Not studied	Yes <sup>7</sup>	N/A	Hypotension (much less common compared with TEA)	Pneumothorax, ipsilateral Horner's syndrome
IT opioid analgesia	Yes <sup>16-18</sup>	Not studied	Yes <sup>16</sup>	N/A	Nausea, vomiting, pruritus	Injury to neuraxis
Continuous wound catheter analgesia	Questionable <sup>19,20</sup>	Not studied	Not studied	No <sup>20</sup>	Redness, swelling	Local anesthetic toxicity
TENS	Yes <sup>21-24</sup>	Not studied	Yes <sup>21-23</sup>	Yes <sup>22</sup>	Skin irritation	None reported
Cryoanalgesia	Questionable <sup>26</sup>	No; associated with an increased incidence of chronic neuropathic pain <sup>25,27</sup>	Not studied	Not studied	Neuropathic pain	Pneumothorax, increased pain
TIVA (remifentanil and propofol)	Yes <sup>63</sup>	Yes <sup>63,64</sup>	Not studied	Not studied	Increased intraoperative hypotension	Possible increased incidence of intraoperative awareness
GETA with sevoflurane	No <sup>63</sup>	No	Not studied	Not studied	Nausea, vomiting, hypotension	Malignant hyperthermia

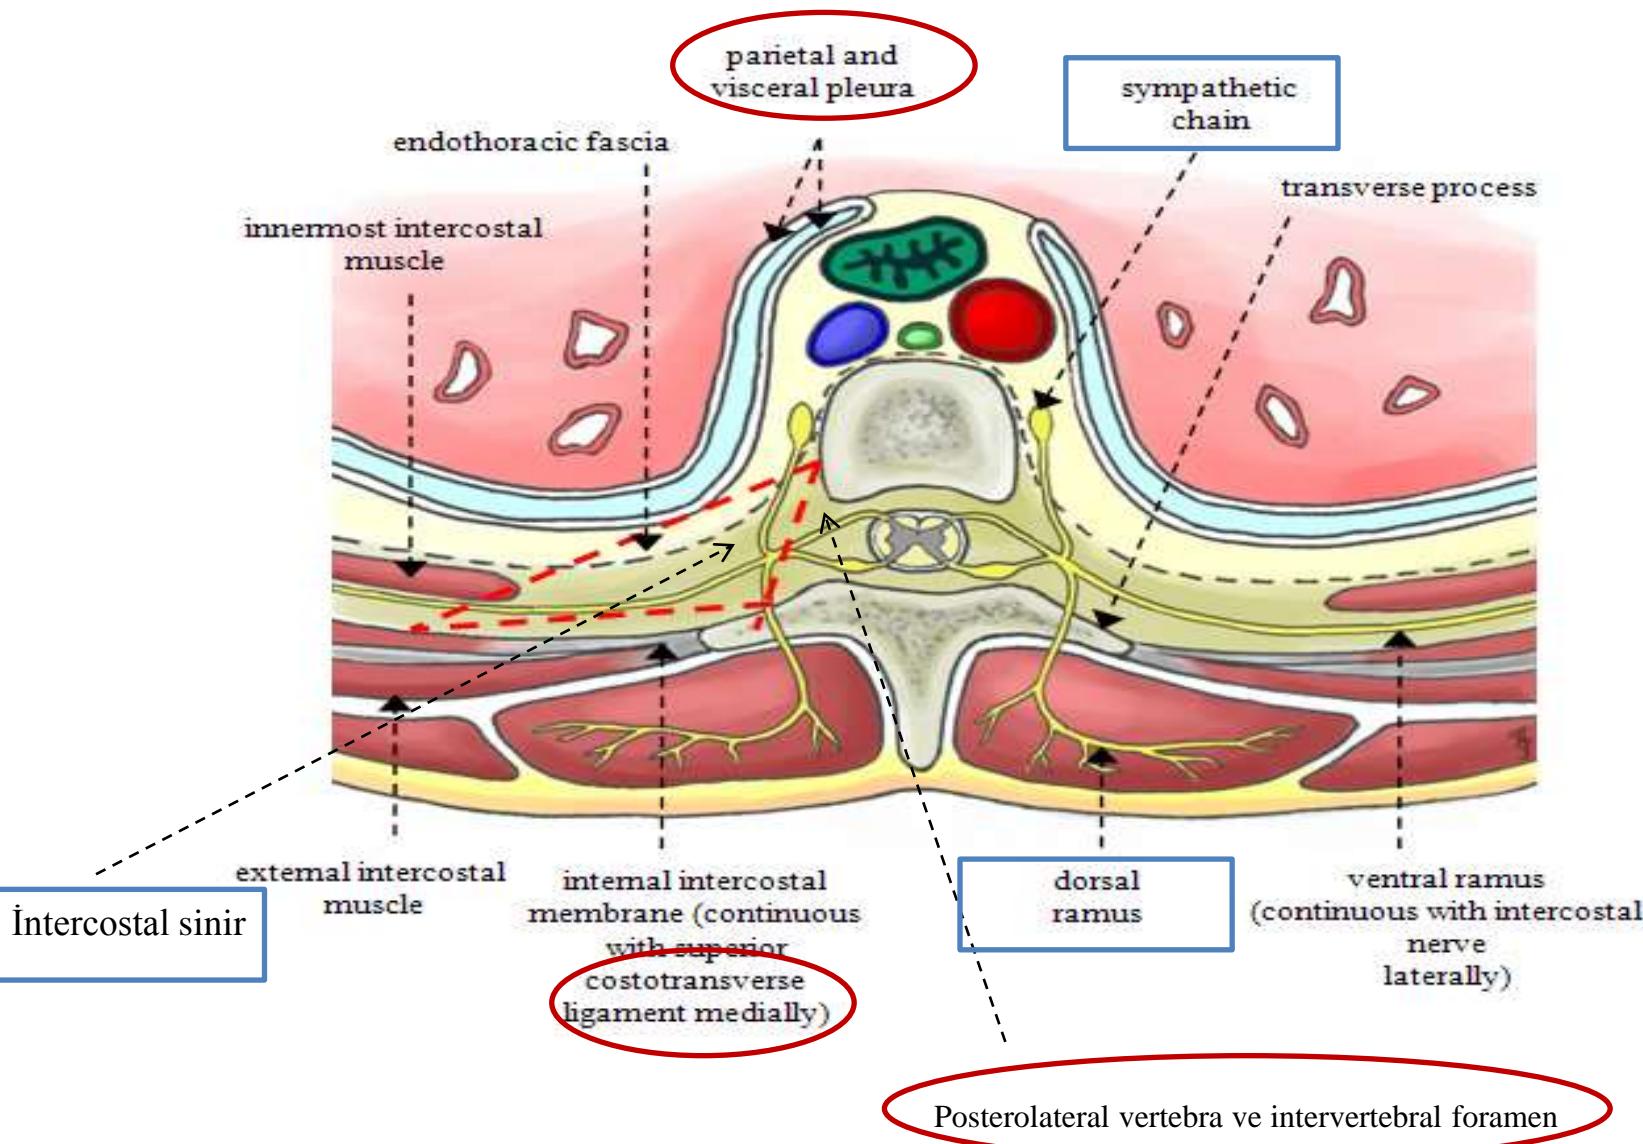

Abbreviations: CPTP, chronic post-thoracotomy pain; GETA, general endotracheal anesthesia; IT, intrathecal; N/A, not applicable; TEA, thoracic epidural analgesia; TPVB, thoracic paravertebral block; TENS, transcutaneous electric nerve stimulation; TIVA, total intravenous anesthesia

- 78 çalışma
- TPVB, TEA ile kıyaslanabilir analjezik etkinliğe sahip
- Farmakolojik adjuvanlarla post-torakotomi analjezisinde TEA ye alternatif olabilir

# Torakal Paravertebral Blok

- Sellheim
  - 1905, abdominal analjezi
- Lawen
  - 1911 '*paravertebral conduction anesthesia*'
- Kappis
  - 1919, cerrahi anestezi, abdominal op
- Eason & Wyatt
- 1979, TPVB, kateter tekniği

# Torakal Paravertebral Blok

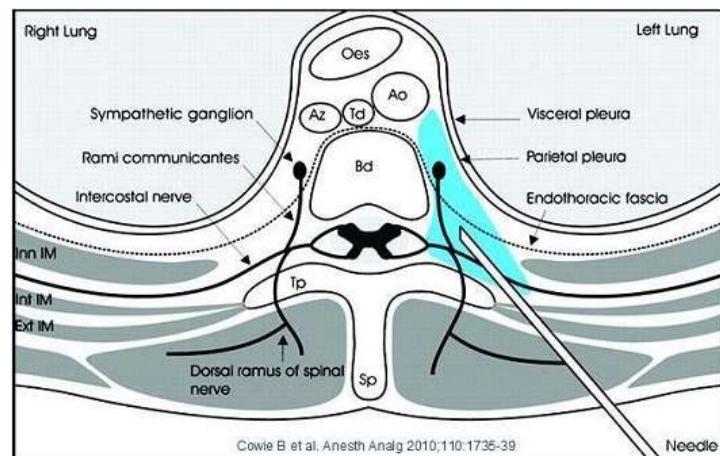

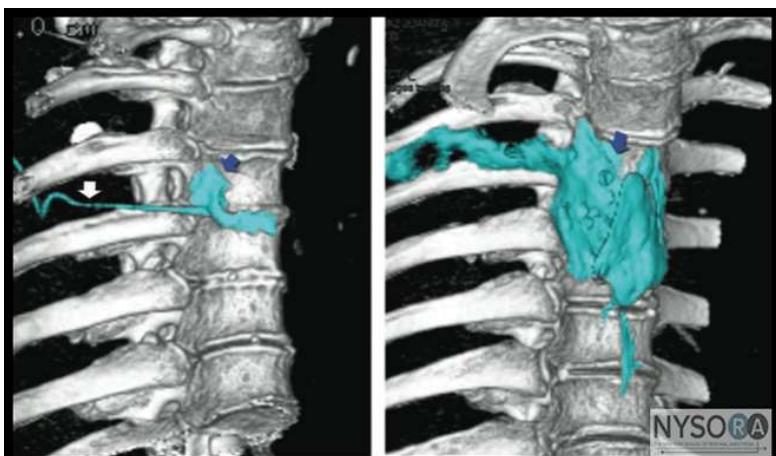

# Torakal Paravertebral Blok

- Klasik yöntem
  - Lateral yaklaşım
  - Medial yaklaşım
  - Cerrah tarafından direkt görüş
  - Direnç kaybı yöntemi
  - Basınç transducer
  - Nörostimülasyon tekniği
- ✓ Ultrason eşliğinde

# Mekanizması ve Anestezinin Yayılımı

- Enjekte edilen seviyede lokalizasyon
- Bitişik seviyelere ↑ ↓ dağılım
- İnterkostal alan
- Epidural bölge
- Yerçekimine göre hareket yok, kaudal yayılım ↑
- İlacın dağılımı ile duyu kaybı olan bölge arasında tutarsızlık %29
  - İlk görüntünden sonra epidural alana sekonder dağılım

Curr Opin Anesthesiol, 28:588 2015

## TPVB Endikasyonları

- Unilateral operasyonlar
  - Açık torakotomi
  - VATS
  - Minimal invaziv kardiyak cerrahiler
- Pektus ekskavatum onarımı (özellikle çocuklar için)
- Multipl kosta kırığı

## TPVB Kontrendikasyonları

- İğne giriş yerinde enfeksiyon
- Ampiyem
- LA karşı allerji
- TPV alanda tümör

# TPVB Komplikasyonları

- Plevral ponksiyon (%1) ve pnömotoraks (%0.5)
- Hematom (%2.4)
- Epidural ve intratekal yayılım (%1-70)
  - Medial yaklaşım tekniği, ultrason kullanımı
  - LA 15 mL ↑
  - Deneyim
  - Spinal deformite
- Enfeksiyon
- Sinir hasarı (sensoriyal, motor Ø)
- Hipotansiyon (%4)
- Horner sendromu

# TPVB Avantajları

## TEKNİK

- Basit ve öğrenmesi kolay
- TEA'den güvenli ve kolay
- Sedatize ve ventile edilen hastalarda da güvenli
- Torasik cerrahi sırasında görerek kateter yerleştirilmesi ile güvenli ve doğru sonuç

## KLİNİK

- Tek enjeksiyonla multidermatomal ipsilateral somatik ve sempatik sinir blokajı
- Post. ramusu bloke eder
- Kortikal yanımı kaldırır
- Stres yanımı ↓
- **Hemodinamik stabilité**
- Opioid gereksinimini ↓
- Komplikasyon riski ↓
- Motor güç ve mesane yanıtını korur
- Erken mobilizasyon

# TEA avantajları

- Dinamik ağrıyı ↓, ‘*Altın Standart*’
- PL torakotomilerde (6 dermatom)
- Mukosilier aktivite, oksijenasyon ↑
- Pulmoner komplikasyonlar, atelektazi, ve enfeksiyon ↓
- Stres ve sempatik yanıtı ↓
- Endokardiyal ve epikardiyal kan akımı ↑, KH ↓
- İskemik miyokardda O<sub>2</sub> sunumu ve tüketimini dengeler
- LV fonk ↑, KVS komplikasyonlar ↓
- Disritmiler ↓
- Tromboembolik komplikasyonlar ↓
- Barsak motilitesini ↑
- İmmun sistemi ↑
- Yüksek riskli hastalarda avantajlar ↑

# A comparison of epidural and paravertebral catheterisation techniques in post-thoracotomy pain management<sup>§</sup>

Gultekin Gulbahar <sup>a,\*</sup>, Bulent Kocer <sup>a</sup>, Serife Nursel Muratli <sup>b</sup>, Erkan Yildirim <sup>c</sup>, Ozlem Gulbahar <sup>d</sup>, Koray Dural <sup>a</sup>, Unal Sakinci <sup>a</sup>

## PL Torakotomi

VAS, FEV1, PEFR, serum kortizol düzeyi, KS

TE kateter preop, TPV kateter intraop

Op sonunda HKA 0.1 ml/kg/st %0.25 bupivakain  
(2 ml bolus, 1 st kilit)

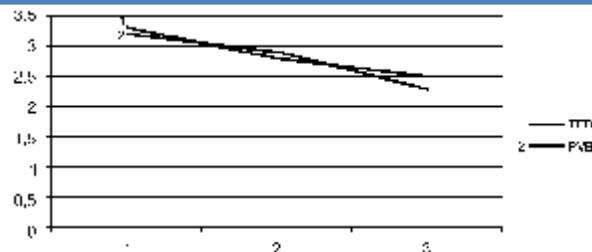

Fig. 1. Mean postoperative pain scores. Although it has been seen a tendency for a decrease in the postoperative pain scores toward the third day in both groups in the graph, there was no statistically significant difference detected regarding analgesic efficiency.

TPV kateterin görerek yerleştirilmesi güvenli  
Analjezi etkin ve eşit  
KS ve kortizol düzeyi aynı  
Yan etkiler LA yüksek dozuna bağlı  
Kateter yerlesim süresi TPVB'da kısa

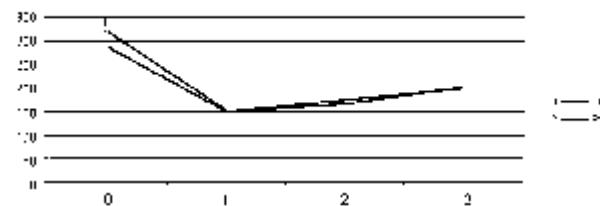

Fig. 2. Mean postoperative PEFR values. Although there were a rapid decline in the PEFR values in both groups in the first postoperative day (1) comparing to the preoperative day (0), there was a tendency for increment toward the third postoperative day. But, no statistically significant difference was detected between the groups related to the PEFR values.

Table 2  
The distribution of the patient groups regarding the study results.

	TEB (n = 19)	PVB (n = 25)	p-value
Side effects	14	0	0.011
Urinary retention	4	0	—
Nausea	5	0	—
Vomiting	3	0	—
Hypotension	2	0	—
Need for ICU	3	1	—
Indication for catheter removal	4	0	—
Unable to place the catheter	2	0	—
The duration for the procedure (min)	$13.21 \pm 3.42$ (9–20)	$4.24 \pm 0.72$ (3–6)	0.000
Hospital stay (day)	$15.74 \pm 5.02$ (6–28)	$14.60 \pm 5.57$ (8–30)	0.269
Postoperative hospital stay (day)	$8.63 \pm 2.16$ (5–12)	$7.96 \pm 2.11$ (4–13)	0.265

TEB: thoracal epidural blockade; PVB: paravertebral blockade; ICU: intensive care unit.

# Paravertebral block via the surgical field versus epidural block for patients undergoing thoracotomy: a randomized clinical trial

	0*†	4.2 ± 1.7	7.1 ± 1.5	7 ± 1.6
	4†	2.9 ± 1.8	4.6 ± 1.8	4.6 ± 1.9

Values are expressed as mean ± SD.

NRS = numeric rating scale; TEA = thoracic epidural analgesia; PCA = patient-controlled analgesia.

\* P < 0.001; † P < 0.01; ‡ P < 0.05 between Group Pre-TEA and Group Post-TEA.

|| P < 0.001; ¶ P < 0.01 between Group Pre-TEA and Group IV-PCA.

§ P < 0.001 between Group Post-TEA and Group IV-PCA.

- Kronik ağrı insidansı ↑
- Ağrı şiddeti ↓
- Pre-TEA olumlu
- Postop akut ağrı ↓

## Effects of Preemptive Epidural Analgesia on Post-thoracotomy Pain

Choon Looi Bong, MBChB, FRCA,\* Miny Samuel, MSc, PhD,† Ju Mei Ng, MBBS, FANZCA,‡ and Chris Ip-Yam, MBChB, FFARCSI, FRCA, FAMS, MBA‡  
*Journal of Cardiothoracic and Vascular Anesthesia*, Vol 19, No 6 (December), 2005: pp 786-793

- Preemptiv TEA akut ve kronik posttorakotomi ağrısı şiddeti ve insidansına etkisi
- Meta-analiz
- Akut ağrı şiddeti ↓
- Kronik ağrı insidansı üzerine etkisi yok

## Thoracic Paravertebral Block in Chronic Postoperative Pain

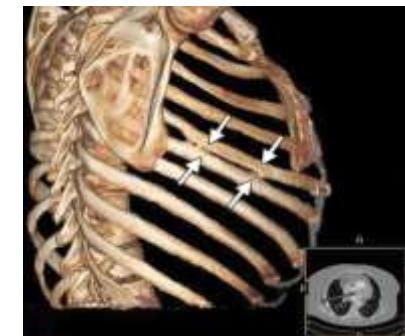

OLLI KIRVELÄ, M.D., PH.D. HEIKKI ANTILA, M.D.

Regional Anesthesia  
1992; 17: 348-350

- TPVB uygulamasının kronik ağrı üzerine etkisini inceleyen klinik deneyimleri
- İnterkostal sinirlerdeki gerilme ve skarlaşma sonucu nöroma oluşmaktadır
- 4 segment için 15-20 mL bupivakain %0.5
- Segment ↑ ise her segmente 5-10 mL (max 25 mL)

TABLE 1. Immediate and Long-term Effects of Thoracic Paravertebral Block in Patients Suffering from Chronic Post-thoracotomy Pain or Chronic Pain after Mastectomy

Indication	Age (median, range); sex (F/M)	Duration of pain (median, range)	No. of blocks	Duration of pain relief (%)
Chronic post-thoracotomy pain	66, 35-86; 7/15	3.5 years, 1 month-20 years	169	>1 month (58) >2 months (30) >4 months (8) >5 months (3) <1 week (6) <1 month (88) >5 months (6)
Chronic pain after mastectomy	45, 42-70; 10/0	1.5 years, 2 months-3 years	112	

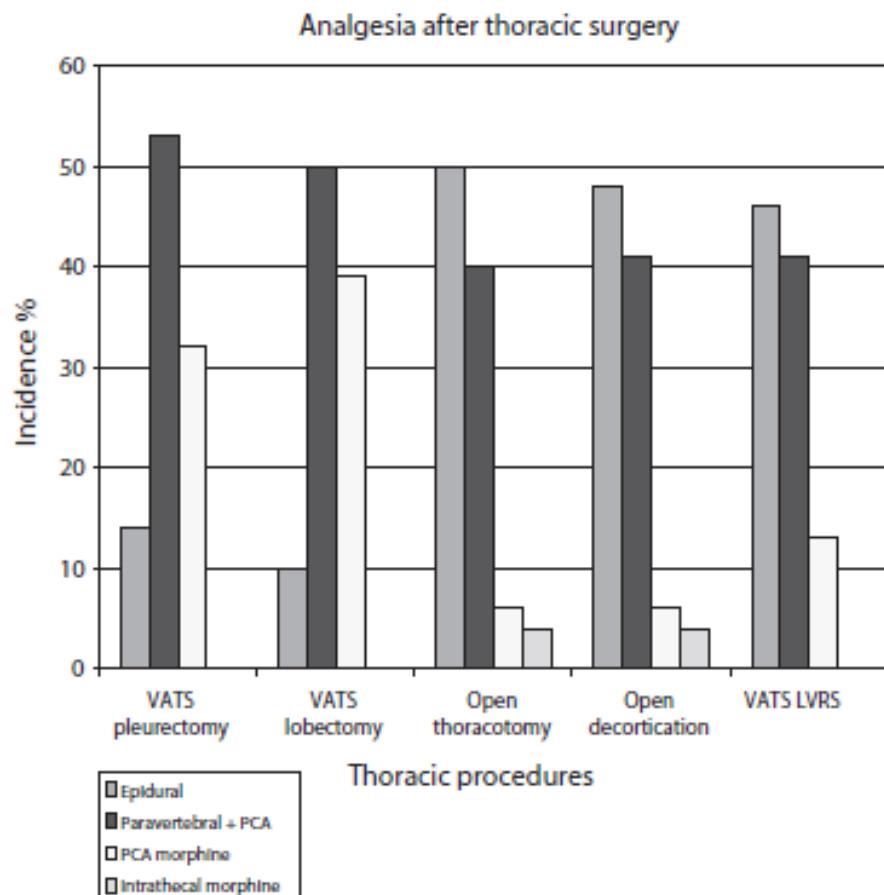

# Analgesic techniques following thoracic surgery: a survey of United Kingdom practice

Naren C. Kotemane, Niraj Gopinath and Rakesh Vaja

Eur J Anaesthetol 2010;27:897–899

- Toraks op. postop analjezi tercihleri
- 36 torak cerrahi merkezi
- 240 anestezist
- %78 yanıt / 187 anestezist
- Cerrahi işlem
- Cerrahi yöntem
  - Torakotomi
  - VATS
- Postop analjezi teknikleri
  - TEA
  - TPVB
  - İV HKA

# A French Nationwide Survey on Anesthesiologist-Perceived Barriers to the Use of Epidural and Paravertebral Block in Thoracic Surgery

Christian Dualé, MD, PhD,<sup>\*†</sup> Guillaume Gayraud, MB,<sup>\*‡</sup> Hammou Taheri, MB,<sup>\*§</sup> Olivier Bastien, MD, PhD,<sup>¶||\*\*</sup>  
and Pierre Schoeffler, MD<sup>†¶††</sup>

Journal of Cardiothoracic and Vascular Anesthesia, Vol 29, No 4 (August), 2015: pp 942–949

- TEA veya TPVB'un kullanımını engelleyen faktörlerin araştırılması
- Torasik cerrahi klinikleri 103 / 84 (%81.6)
- Torakoskopi: 13,089, Torakotomi 14,067
- Gerçek kullanım ile algılanan engeller arasındaki Korelasyonda farklılıklar
  - Zaman kaybı ve buna bağlı isteksizlik
- 'Complexity': yetersiz eğitim
- TPVB: Dr.lar eğitilmeli, yaygınlaştırılmalı
- Bu tekniklerin yararları iş arkadaşlarına analtılmalı

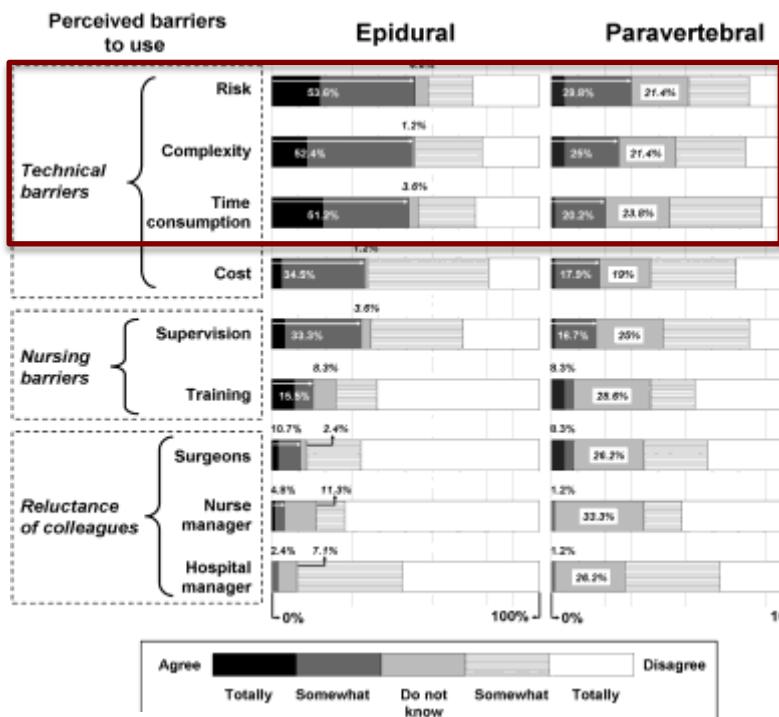

Table 2. Correlation Matrix: Barriers Versus Actual Practice

Variables	Epidural Block		Paravertebral Block	
	p	p Value	p	p Value
Activity per center*	-0.164	0.135	<b>0.228</b>	<b>0.037</b>

Reluctance of colleagues				
Surgeons	-0.279	<b>0.010</b>	<b>-0.353</b>	<b>0.001</b>
Nurse manager	-0.348	<b>0.001</b>	<b>-0.317</b>	<b>0.003</b>
Hospital manager	-0.346	<b>0.001</b>	<b>-0.364</b>	<b>0.001</b>

# Sonuç olarak

- TPVB, TEA ile kıyaslanabilecek analjezi oluşturmaktadır
- Özellikle diğer farmakolojik adjuvanlarla TEA'e alternatifdir
- TEA'nın yararları geçmişte düşünüldüğünden daha sınırlı
- TEA ile maliyet açısından olumlu sonuç yok
- Profilaktik antikoagülanların kullanılıyorsa TEA riskli olabilir
- TPVB ile tek taraflı sempatik blokaj elde edildiği için kardiyovasküler stabilité daha kolay sağlanmaktadır
- İnterkostal kasların tek taraflı etkilenmesi respiratuvar rezervi olumlu etkilemektedir
- TEA toraks operasyonlarında analjezi için 'altın standart' değil

- Postop analjezi yöntemi seçilirken
  - Cerrahi işlem
  - Hastanın özellikleri
  - Anestezistenin yöntemle ilgili bilgi ve becerisi dikkate alınmalı
- Hangi teknik olursa olsun toraks cerrahisinde temel dayanak noktası multimodal postoperatif analjezi

**Tesekkürler**
